1 - Introduction

Reporting research is as important a part of a study as its design or analysis

Poorly conducted trials are a waste of time, effort, and money. The most dangerous risk associated with poor-quality reporting is an overestimate of the advantages of a given treatment ... Whatever the outcome of a study, it is really hard for the average reader to interpret and verify the reliability of a poorly reported RCT. In turn, this problem could result in changes in clinical practice that are based on false evidence and that may harm patients. The only way to avoid the risk and to be sure that the final message of a RCT can be correctly interpreted is to fulfill the items listed in the CONSORT statement.

1 - Introduction
CHAPTER 1

Importance of Transparent Reporting of Health Research

Douglas G. Altman\textsuperscript{1} and David Moher\textsuperscript{2}

\textsuperscript{1}Centre for Statistics in Medicine, University of Oxford, Oxford, UK
\textsuperscript{2}Clinical Epidemiology Program, Ottawa Hospital Research Institute, Ottawa, ON, Canada
1 - Introduction

What do we mean by inadequate reporting of research?

Systematic assessments of published articles highlight frequent, serious shortcomings. These include but are not limited to:

- Omissions of crucial aspects of study methods, such as inclusion and exclusion criteria, precise details of interventions, measurement of outcomes, statistical methods,
- Statistical errors,
- Selective reporting of results for only some of the assessed outcomes,
- Selective reporting of statistical analyses (e.g. subgroup analyses),
- Inadequate reporting of harms,
- Confusing or misleading presentation of data and graphs,
- Incomplete numerical presentation of data precluding inclusion in a later meta-analysis
- Selective presentation of results in abstracts or inconsistency with the main text
- Selective or inappropriate citation of other studies
- Misinterpretation of study findings in the main article and abstract („spin“)

Altman and Moher, 2012

All these issues introduce various types of publication biases
2 - Weakness of research

Earlier statements about poor quality of research

• Methodology

„...less than 1% of research workers clearly apprehend the rationale of the statistical techniques they commonly invoke“
Hogben L., 1950

„...almost any volume of a medical journal contains faults that can be detected by first-year students after only three or four hours’ guidance in the scrutiny of reports.“
Mainland D., 1952

• Reporting

„...incompleteness of evidence is not merely a failure to satisfy a few highly critical readers. It not infrequently makes the data that are presented of little or no value.“
Mainland D., 1938

„...the idea is to give all of the information to help others to judge the value of your contribution; not just the information that leads to judgement in one particular direction or another.“
Feynman R., 1974

For further references see Altman and Simera, 2016
As the system encourages poor research it is the system that should be changed. We need less research, better research, and research done for the right reasons.
Why Most Published Research Findings Are False

John P.A. Ioannidis

I worry about sloppiness in biomedical research: too many published results are true only under narrow conditions, or cannot be reproduced at all. The causes are diverse […].

The main question when reviewing a paper should be whether its conclusions are likely to be correct, not whether it would be important if it were true. Real advances are built with bricks, not straw.
2 - Weakness of research

Given small sample sizes, loss of animals in preclinical experiments can dramatically alter results.

We need better animal research, better reported

Fiona Godlee editor in chief

BMJ (2018), 360:k124
How should medical science change?

In 2009, we published a Viewpoint by Iain Chalmers and Paul Glasziou called “Avoidable waste in the production and reporting of research evidence”, which made the extraordinary claim that as much as 85% of research investment was wasted.

Our belief is that research funders, scientific societies, school and university teachers, professional medical associations, and scientific publishers (and their editors) can use this Series as an opportunity to examine more forensically why they are doing what they do—the purpose of science and science communication—and whether they are getting the most value for the time and money invested in science.

Kleinert and Horton 2014
Of 1575 reports about cancer prognostic markers published in 2005, 1509 (96%) detailed at least one significant prognostic variable. However, few identified biomarkers have been confirmed by subsequent research and few have entered routine clinical practice. This Pattern — initially promising findings not leading to improvements in health care — has been recorded across biomedical research. So why is research that might transform health care and reduce health problems not being successfully produced?

Global biomedical and public health research involves billions of dollars and millions of people. In 2010, expenditure on life sciences (mostly biomedical) research was US$240 billion. The USA is the largest funder, with about $70 billion in commercial and $40 billion in governmental and non-profit funding annually, representing slightly more than 5% of US health-care expenditure. Although this vast enterprise has led to substantial health improvements, many more gains are possible if the waste and inefficiency in the ways that biomedical research is chosen, designed, done, analysed, regulated, managed, disseminated, and reported can be addressed.
Initiatives to improve the situation

Reporting

Reporting guidelines for main study types

- Randomised trials
- Observational studies
- Systematic reviews
- Study protocols
- Diagnostic/prognostic studies
- Case reports
- Clinical practice guidelines
- Qualitative research
- Animal pre-clinical studies
- Quality improvement studies
- Economic evaluations

CONSORT  Extensions
STROBE  Extensions
PRISMA  Extensions
SPIRIT  PRISMA-P
STARD  TRIPOD
CARE  Extensions
AGREE  RIGHT
SRQR  COREQ
ARRIVE  SQUIRE
CHEERS

See all 418 reporting guidelines
3 - EQUATOR

CONSORT extensions

- Crossover trials
- Multi-arm
- Cluster RCT
- Social and psychological interventions
- Within Person RCT
- Harms
- Patient reported outcome
- ...
Extensions of STROBE

- Genetic Association Studies (STREGA)
- Molecular Epidemiology (STROBE-ME)
- STROBE checklist for conference abstracts
- Molecular epidemiology for infectious diseases (STROME-ID)
- Observational Routinely-collected health Data (RECORD)
- Epidemiology for Newborn Infection (STROBE-NI)

... and many more
4 - REMARK

Issues of (prognostic) biomarker research

• 'Hot topic' – many papers.

Nevertheless, only few biomarkers reach clinical application

McShane (2005): „What are we missing?“
Kyzas (2007): „Almost all articles on cancer prognostic markers report statistically significant results“

• Issues:
  - Lack in well-defined research goal, limited research funding
  - Poor study design, e.g. unrepresentative sample, too small study population
  - Incorrect methods, but NOT restricted to statistical analysis e.g. inadequate specificity and sensitivity of assays
  - Reporting issues
Reporting issues

- Issues:
  - Non-publication
  - Incomplete (poor) reporting
  - Selective reporting
  - Misinterpretation/mispresentation

- Effect:
  Bias in any form

- Way out:
  - Reporting guidelines
  - Call for study registry
4 - REMARK

Guidelines

REporting recommendations for tumour MARKeR prognostic studies (REMARK)

Lisa M. McShane *, Douglas G. Altman, Willi Sauerbrei, Sheila E. Taube, Massimo Gion, Gary M. Clark, for the Statistics Subcommittee of the NCI-EORTC Working Group on Cancer Diagnostics

Guidelines and Guidance

Reporting Recommendations for Tumor Marker Prognostic Studies (REMARK): Explanation and Elaboration

May 2012 | Volume 9 | Issue 5 | e1001216

Douglas G. Altman¹*, Lisa M. McShane², Willi Sauerbrei³, Sheila E. Taube⁴
4 - REMARK

Explanation and Elaboration papers

• Good examples
• Basic background of analysis issues

**Conclusion:**

1. studies still poorly reported
2. call for combined effort
We live in the time of Evidence Based Medicine

Systematic reviews and meta-analysis relevant for the

• selection of treatment
• but also for prognostic factors, risk factors, diagnostic methods, …

Studies using Individual Patient Data (IPD) need more attention
Does poor reporting matter?

→ YES

Meaningful systematic reviews and informative meta-analysis are impossible
5 - Systematic reviews and meta-analysis

Meta-analysis – mission impossible

• **Bladder cancer**
  “After 10 years of research, evidence is not sufficient to conclude whether changes in P53 act as markers of outcome … decade of research … is frustrating”

• **Coronary disease**
  “Multiple types of reporting bias, and publication bias, … association between CRP and prognosis sufficiently uncertain that no clinical practice recommendations can be made.”

• **Osteosarcoma**
  “93 papers were studied ….Only 7 papers were of sufficient quality to analyze. .. Because of heterogeneity of the studies, pooling results is hardly possible. There is a need for standardization of studies and reports”

• **General**
  “As a consequence of the poor quality of research, prognostic markers may remain under investigation for many years after initial studies without any resolution of the uncertainty. Multiple separate and uncoordinated studies may actually delay the process of defining the role of prognostic markers”.
6 - Analysis - structured reporting

More structured reporting is required

Participant flow diagram is well accepted but what about reporting of statistical analyses?

Often, many analyses (e.g. subgroups, additional outcomes) are hidden in the text.

What about checks of important assumptions (e.g. proportional hazards in the Cox model)? Done?
6 - Analysis - structured reporting

On Fishing for Significance and Statistician’s Degree of Freedom in the Era of Big Molecular Data

Anne-Laure Boulesteix¹, Roman Hornung², Willi Sauerbrei³

In
Item 12.

Describe the **flow of patients** through the study, including the number of patients included in each stage of the analysis (a diagram may be helpful) and reasons for dropout. Specifically, both overall and for each subgroup extensively examined report the **number of patients and the number of events**.
6 - Analysis - structured reporting

Reporting of Item 12 is still bad

Winzer et al. 2016
Abstract
Prediction models are developed to aid health care providers in estimating the probability or risk that a specific disease or condition is present (diagnostic models) or that a specific event will occur in the future (prognostic models), to inform their decision making. However, the overwhelming evidence shows that the quality of reporting of prediction model studies is poor. Only with full and clear reporting of information on all aspects of a prediction model can risk of bias and potential usefulness of prediction models be adequately assessed. (...)
7 - Diagnostic and prognostic models

Figure 1 Schematic representation of diagnostic and prognostic prediction modeling studies.

Diagnostic multivariable modeling study

Subjects with presenting symptoms

Predictors:
Patient characteristics (symptoms & signs)
Imaging tests
Laboratory tests
Others

Outcome:
Disease present or absent

Cross-sectional relationship

T = 0

Prognostic multivariable modeling study

Subjects in a health state

Predictors:
Patient characteristics
Disease characteristics
Imaging tests
Laboratory tests
Others

Longitudinal relationship

Outcome:
Development of event Y

T = 0

End of follow-up

7 - Diagnostic and prognostic models

Overinterpretation and misreporting of prognostic factor studies in oncology: a systematic review

Emmanuelle Kempf¹,², Jennifer A. de Beyer¹, Jonathan Cook¹, Jane Holmes¹, Seid Mohammed¹, Tri-Long Nguyễn¹,³, Iveta Simera⁴, Marialena Trivella¹, Douglas G. Altman¹, Sally Hopewell¹, Karel G. M. Moons⁵,⁶, Raphael Porcher⁷, Johannes B. Reitsma⁵,⁶, Willi Sauerbrei⁸ and Gary S. Collins¹,⁹

Cancer prognostic biomarkers have shown disappointing clinical applicability. The objective of this study was to classify and estimate how study results are overinterpreted and misreported in prognostic factor studies in oncology.

[...] 17 oncology journals with an impact factor above 7.

[...] 98 studies included [...] the prognostic factors’ effects were selectively and incompletely reported in 35/98 and 24/98 full texts, respectively.

One in five articles had discussion and/or abstract conclusions that were inconsistent with the study findings. Sixteen reports had discrepancies between their full-text and abstract conclusions.

CONCLUSIONS: Our study provides evidence of frequent overinterpretation of findings of prognostic factor assessment in high-impact medical oncology journals.

Reporting guidelines - summary

- Research in health sciences needs to improve
- Though many parts are difficult (timewise, costly) good reporting is easy:
  Follow reporting guidelines!
- The importance of complete and transparent reporting of all statistical analyses (otherwise “fishing for significance”) is still underrated
- REMARK type profile is a suitable instrument for improvement
However, good reporting does not help if a study is badly designed or analyzed

Statistical methodology – Current situation

- Substantial development over last decades
- Computer facilities
- Assess properties of complex models using simulation studies
- Resampling and Bayesian methods now easily available
- Wealth of new statistical software packages
- Unfortunately, many sensible improvements are ignored in routine analyses

Reasons:

- Overwhelming concern with theoretical aspects
- Very limited guidance on key issues that are vital in practice, discourages analysts from utilizing more sophisticated and possibly more appropriate methods in their analyses
Better use of statistical methods

At least two tasks are essential:

1. **Experts** in specific methodological areas have to work towards developing guidance
2. An ever-increasing need for **continuing education** at all stages of the career

For busy applied researchers it is often difficult to follow methodological progress even in their principal application area

- Reasons are diverse
- Consequence is that analyses are often deficient

Knowledge gained through research on statistical methodology needs to be transferred to the broader community

Many analysts would be grateful for an overview on the current **state of the art** and for practical guidance
Aims of the initiative

- Provide evidence supported guidance for highly relevant issues in the design and analysis of observational studies.
- As the statistical knowledge of the analyst varies substantially, guidance has to keep this background in mind. **Guidance** has to be provided at several levels.
- For the start we will concentrate on state-of-the-art guidance and the necessary evidence.
- Help to identify questions requiring much more primary research.

The overarching long-term aim is to improve key parts of design and statistical analyses of observational studies in practice.
Topic group 2:

Selection of variables and their functional forms in multivariable analysis
Many strategies for variable selection available - more new methods needed?

“[…] in statistical research and related methodology-oriented fields such as machine learning or bioinformatics, the well-known adage ‘publish or perish’ could be translated into ‘propose new methods or perish.’

Such a research paradigm is not favorable for studies that aim at meaningfully comparing alternative existing methods or, more generally, studies assessing the behavior and properties of existing methods.

It becomes more and more difficult to get an overview of existing methods, not to mention the overview of their respective performances in different settings.”

Boulesteix et al. 2018
### State-of-the-art in selection of variables and functional forms in multivariable analysis – outstanding issues

#### Relevant issues in deriving evidence-supported state-of-the-art guidance for multivariable model building

Journal of the European Medical Writers Association (EMWA)
The PROGnosis RESearch Strategy (PROGRESS) Partnership is a UK Medical Research Council (MRC) funded, international, interdisciplinary collaboration developing understanding in research into quality of care outcomes, prognostic factors, risk prediction models, and predictors of differential treatment response.

The objectives of the Partnership are:

• To critically develop concepts, methods and recommendations for improving prognosis research, and systematically apply these across different disease areas, in order to enhance the translational impact of prognosis research;
• Bring together leaders in different clinical disciplines for novel collaborative opportunities;
• To develop guidelines, workshops and prognosis research training courses

<tbody>
<tr>
<td><strong>1 Fundamental shift</strong> <em>(1,2,3,4)</em></td>
<td>Improvements in electronic health records, clinical imaging, and -omic technologies (genotyping and phenotyping) are beginning to challenge current disease taxonomy, clinical pre-occupation with diagnosis (rather than risk) and the focus of health care policy on process (rather than clinical outcomes).</td>
<td>There should be a fundamental shift in clinical practice, translational research and health care policy based on evidence from prognosis research i.e. the prospective relationships between the phenotypic, genomic and environmental assessment of people with a given startpoint and subsequent endpoints.</td>
</tr>
<tr>
<td><strong>2 Systems</strong> <em>(1,2,3,4)</em></td>
<td>Over the lifecourse individuals develop multiple diseases (both distinct and related) that often are not reflected in the current organisation of medical research or practice.</td>
<td>There should be an expansion of prognosis research which bridges multiple clinical specialities, health systems, pathological mechanisms, and biological systems and puts the whole patient across their ‘journey’ as the central unit of concern.</td>
</tr>
<tr>
<td><strong>3 Electronic health records</strong> <em>(1,2,3,4)</em></td>
<td>The scope and impact of prognosis research and electronic health records research (in primary and secondary care, and in disease and procedure registries) are intimately related.</td>
<td>There should be new programmes of methodological and empirical prognosis research exploiting electronic health records to define, phenotype and follow up people with different health related conditions.</td>
</tr>
<tr>
<td><strong>4 Field</strong> <em>(1,2,3,4)</em></td>
<td>Prognosis research is currently fragmented and not visible as a distinct entity.</td>
<td>Prognosis research should be recognised as a field of enquiry important in translational research, and intrinsic to the practice of clinical medicine and development of health care policy. Efforts should be made to establish prognosis research as a distinct branch of knowledge, with a set of scientific methods aimed at understanding and improving health.</td>
</tr>
<tr>
<td><strong>5 Comparing prognosis</strong> <em>(1)</em></td>
<td>The relative impact of having, compared to not having, a health condition on survival or symptom status helps identify priorities for translational research but is uncommonly reported outside the field of cancer.</td>
<td>There should be greater efforts to compare prognosis between those with and without a given condition, and between different conditions.</td>
</tr>

**Reproducible Research**

Triggered by problems identified in working with omics data
Further remarks

The Ninth International Congress on Peer Review and Scientific Publication
A Call for Research

September 12-14, 2021 in Chicago

The quantity and quality of scientific research have never been greater, but with unprecedented promise comes unprecedented peril. There are better scientific policies and processes, stronger standards for openness and transparency, and innovative technologies to collaborate and publish. However, the rapidly evolving scientific publication ecosystem that facilitates research dissemination also enables research waste, predation, and piracy. The challenge of distinguishing information from noise, innovation from dystopianlike disruption, and opportunity from threat has created new levels of excitement and angst for those engaged in research and its reporting, publication, and distribution.

John P. A. Ioannidis, MD, DSc; Michael Berkwits, MD, MSCE; Annette Flanagin, RN, MA; Fiona Godlee, MBBChir, FRCP; Theodora Bloom, PhD

JAMA, September 2019
Further remarks

**Substantial development of statistical methodology**

**...and application in practice...**

“Scientists‘ grasp of statistics has not kept pace with the development of complex mathematical techniques for crunching data. Some scientists use inappropriate techniques because those are the ones they feel comfortable with; others latch on to new ones without understanding their subtleties. Some just rely on the methods built into their software, even if they don‘t understand them.“

Unreliable Research: Trouble at the lab[The Economist 2013]
Further remarks

Weaknesses in analyses can have severe consequences for patients

“A mistake in the operating room can threaten the life of one patient; a mistake in statistical analysis or interpretation can lead to hundreds of early deaths. So it is perhaps odd that, while we allow a doctor to conduct surgery only after years of training, we give SPSS to almost anyone.”

Professor Doug Altman, co-founder of the EQUATOR Network, has been awarded the BMJ Lifetime Achievement Award in recognition of his outstanding contribution to the improvement of the scientific and medical research literature. Professor Altman is one of the world’s leading experts in health research methodology, statistics and reporting and has spent his career working to improve transparency in the conduct and reporting of health research. Over the years Professor Altman has led or been involved in developing many of the reporting guidelines listed on the EQUATOR website.

The BMJ states “Altman has done more than anybody to raise the standards of medical publication and in the process has transformed the role of statistician from number cruncher to custodian of important but often neglected values”.

Fiona Godlee, Editor-in-chief of The BMJ said “he has done more than anyone else to encourage researchers to fully report what they actually did, warts and all, rather than letting the best be the enemy of the good or, worse, pretending that research is perfect”.

BMJ Lifetime Achievement Award (2015)
